

I'm writing to support the Lavernock Point to Brean Down option.

Most scientists seem to agree the planet is heating up at a dangerous rate and all life on Earth faces devastating consequences. If these scientists are right then the Severn estuary eco-system will be utterly devastated by global warming.

A massive contribution to Britain helping to stop global warming would be to construct a barrage across the Severn to harness as much green energy as possible. This would bmean the Lavernock Point to Brean Down option.

If the scientists are right then we are currently staring in to a global warming abyss. In the little time we have left to combat climate change I believe we should spend as much money on green energy as both governments and the private sector can afford.

If there's £9bn to be found for a two-week sport festival, aka the London Olympics, then £15bn for 5% of the UK's energy supply seems peanuts.

Regards

Chris Lewis
